HOW TO MAKE MONEY IN THE MARIJUANA STOCK MARKET EL NINO, CALIFORNIA WATER AND GROWING

It is clear that a possible powerful El Niño is expected this fall, and will last until spring of 2016. The odds are that about 85% that El Niño will come. Aol.com posted the following:

"The weak El Niño in the winter of 2006-07 provided a totally different story than what we saw in the very strong 1997-98 El Niño winter.

California had its 23rd driest winter season on record when looking at the three-month period from December 2006 to February 2007. In Los Angeles, the entire water year from July 2006 to June 2007 was the driest on record with just 3.21 inches of rainfall.

So, those hoping for drought relief next winter in the Golden State shouldn't immediately draw a conclusion that significant rains are ahead in any El Niño year. The strength of the El Niño can play a role in the outcome. In addition, heavy rainfall can occur with or without El Niño present and that was the case in the winter preceding the strong 1997-1998 El Niño."

The question is whether El Niño will end the California drought in 2016?

I would think this El Niño will fill up streams, make water available to marijuana plants and the agriculture industry.

Whether this is temporary in 2016 or not is not known. These rains will somewhat mute opposition to recreational marijuana in California's 2016's vote.

If so, this will be an advantage for pro recreational pot in California and in the USA.
