IR Research Reports (1,000+) - Distribution to 100s of thousands of investors

## HOW TO MAKE MONEY IN THE MARIJUANA STOCK MARKET IS POT BAD FOR YOU?

The Daily Dose today published the following.

"THE WASHINGTON POST- With the widespread availability of marijuana in recent years thanks to its legalization in a growing number of states, there has been increasing concern about the long-term health consequences on teens who might be able to get easier access to it illegally.

A study published by the [American Psychological Association](#) in the Journal Psychology of Addictive Behaviors this week should alleviate some of the worst fears.

Researchers from the University of Pittsburgh Medical Center and Rutgers University studied 408 males from adolescence to their mid-30s. The participants fell into four groups: those with no use or low use of marijuana, early chronic users, those who only smoked during their teens and those who began using it later and continued using the drug. The early chronic users smoked a great deal -- a peak of more than 200 days per year on average when they were 22 years old.

The researchers found no links to physical or mental health issues -- including depression, psychotic symptoms or asthma -- in any group, even those with very high use. They controlled for cigarette smoking, other drug use, access to health insurance and other factors."

The article is worthwhile reading.

There are studies that conclude the opposite.
